IsoId=P97797-3; Sequence=VSP_007031;
spinal cord, cerebellum and spleen, and at much lower levels in kidney, thymus, heart, lung and liver. Within the cerebellum, highly expressed throughout the molecular layer, and in synaptic glomeruli in the granule cell layer. Detected in neurons of the hippocampus and dentate gyrus, and in olfactory bulb. Not detected in Purkinje cells. Highly expressed in the plexiform layers, optic fiber layer and the outer segments of the photoreceptor layer in the retina. Highly expressed in macrophages. Isoform 3 is detected at very low levels in all tissues tested.

-i. DEVELOPMENUTAL STAGE: Highly expressed in the CNS of embryos from day 7 to 17.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   EMBL;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        factors or insulin. Mediates negative regulation of phagocytosis, mast cell activation and dendritic cell activation. CD47 binding prevents maturation of immature dendritic cells and inhibits cytokine production by mature dendritic cells (By similarity). SUBUNIT: Binds FTPN11 when tyrosine-phosphorylated, except in macrophages, where it primarily binds FTPN6. Binds GRB2 vitro. Binds FGR. Binds JAK2 irrespective of its phosphorylation status and forms a stable complex. Binds SCAP1 and/or SCAP2. The resulting complex recruits FYB. Binds FYE2B (By similarity). SUBCELLULAR LOCATION: Type I membrane protein.

```
as docking protein and induces translocation of PTPN6,
PTPN11 and other binding partners from the cytosol to the
plasma membrane. Supports adhesion of cerebellar neurons, neurite
outgrowth and glial cell attachment. May play a key role in
intracellular signaling during synaptogenesis and in synaptic
function. Involved in the negative regulation of receptor tyrosine
kinase-coupled cellular responses induced by cell adhesion, growth
factors or insulin. Mediates negative regulation of phagocytosis,
mast cell activation and dendritic cells activation. CD47 binding
prevents maturation of immature dendritic cells. May play a role in
the release of nitric oxide by macrophages (By similarity).
SUBUNIT: Binds PTPN11 when tyrosine-phosphorylated, except in
macrophages, where it primarily binds PTPN6. Binds GRB2 in vitro.
Binds FGR. Binds JAK2 irrespective of its phosphorylation status
and forms a stable complex. Binds SCAP1 and (BY SCAP12. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Takada T., Matozaki T., Takeda H., Fukunaga K., Noguchi Fujioka Y., Okazaki I., Tsuda M., Yamao T., Ochi F., Kas "Roles of the complex formation of SHPS-1 with SHP-2 in insulin-stimulated mitogen-activated protein kinase acti J. Biol. Chem. 273:9234-9242(1998).
